

Dear Mr Powell;

I believe that there is a mis-interpretation in the current do not call list that is slipping away and needs to be addressed. I have registered all my numbers on the do not call list, yet every day at promptly 6 am I get a call. The call is a FAX over my do not call number. I have the phone number of the company and I report it every day. I have turned in as many as 25 complaints about the very same company. I believe they are violating the do not call registration, yet nobody will stop it. The fact that I have my fax number the same as my house number is exactly for that reason. I do not wish to get called period.

On another note, I believe that the current Spam law should be expanded to encompass those that pass on spam and computer destroying viruses. I use Cox communications as my cable provider and internet source. I used to have Time Warner. In my 5 years with Time Warner, if I ever got a spam email, I would notify them and it would go away. When I moved to Rancho Santa Fe last year and changed my service to Cox, the spam emails grew to 10 to 30 a day. All my complaints to Cox were met with "not my problem" and "go track it down yourself and complain to the source". They have only just now begun to filter the vicious emails before they come to my computer. I believe strongly that IPV6 on the internet will not only provide an accurate tracking source and allow the spam law to be enforced, but it will also provide tracking for Terrorist organization who send things via the internet from the local internet cafes.

I also believe that we should implement a newer email POP server which can allow the authentication and verification of the senders ID at every node such that anonymous email is a thing of the past.

The internet is far too valuable of a national asset to allow it to be infiltrated by thieves, thugs, and Terrorists. It is a market which legitimately generates more than \$10B a year in GNP. Would we let our Auto market be run by organized crime and our credits cards be ripped off by our local vendors in the same way we allow it to be on the internet?

I hope that you can shed some light on these and make some serious rulings to push for allowing private citizens to at least know who their attacker is each and every morning.
